The video we watched in class was about reader. A reader is free and can be used on google and other websites. The reader is a setup connection between the reader and the users favorite sites. The reader can be used for subscribing for updates and etc.

What is a computer program?

What is the difference between low level and high level language?

Define:

Machine Language- only language a computer directly recognizes

Assembly- instructions made up of symbolic codes, meaningful abbreviations, and codes

Source Program- contains code to be converted to machine language

Procedural language (3GL)- programmers writes instructions that tell computers what to accomplish and how to do it

DHTML- allows developers to include more graphical interest and interactivity in web pages

XHTML- enables web sites to be displayed more easily on micro-browsers

XML- allows developers to create customized legs

WML- allows developers to design pages specifically for micro-browsers

Ajax- method of creating interactive web applications designed to provide immediate response

What apps use Ajax?- google maps and flicker

What is an application service provider, name two?- business that provides computer based services to a customer over a next work. (examples webmail and isp)

What is Multimedia authoring SW? - combines text, graphics, animations, audio, and video into interactive presentation.
